

KSAB Super Spreader

Power & refinement

The Super Spreader has a finely graded scale, allowing you to control the exact dosage. The extra handle makes it easy to lift.

KSAB Super Spreader

The patented double spreader plates of the Super Spreader, provides the market's best and broadest dispersal of fertilizer and seed. The uniform dispersal saves time and money, since there is no need for a second round.

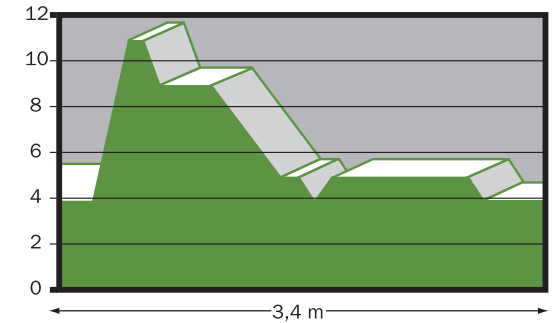

The Super Spreader has an ergonomic handle allowing the user alternate grip for best comfort. The parking wheel, other than used for parking, also makes the spreader roll steadily and always at the same horizontal angle, unaffected by the length of the user. In addition to this, the wheel unburdens the user from "lifting" the weight of the fertilizer load.

The Super Spreader has been sold worldwide by KSAB since 2005.

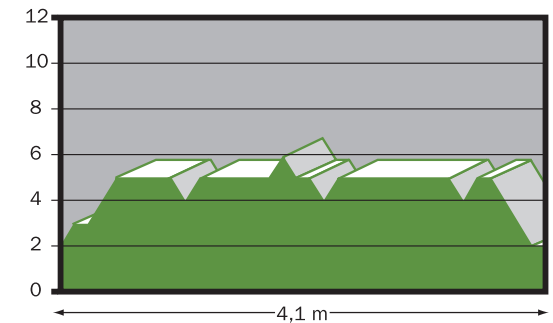

Documented dispersal pattern

The graphs below show the difference in spreading patterns, comparing the Super Spreader to the conventional, single plate spreaders on the market.

Conventional spreader

This graph shows the inconsistent dispersal pattern of conventional spreaders.

The Super Spreader

This graph clarifies the much broader and uniform dispersal of the dual rotor Super Spreader. An overlap of 30-40 cm will cover the area perfectly. The plates are maneuvered (opened/shut) separate from one another.
